

## **Improving Water Conservation** **And Water Use Efficiency**

The area irrigated by tubewells in Fatehgarh District is 1,02,028 hectares & by canals is 451 hectares. Main stress of agriculture land is on ground water. Presently Fatehgarh District has 5 blocks. All the blocks are in dark zone. To get sustainable production, it is the time to manage the natural resources i.e soil & water. Ground water is depleting day by day. The current water decline is nearly 75 cm per year. The situation is alarming for seriously thinking about adoption of water conservation technologies to minimize the declination in water table to sustain the water resources & agricultural productivity.
